STRATEGIES FOR IMPROVING PHYSICIAN DOCUMENTATION IN THE EMERGENCY DEPARTMENT: A SYSTEMATIC REVIEW

Lecturer Name : **Parisa Zarei**

Supervisor Name : **Dr. Somayeh Fazaeli**

Email Address : **Zareip971@mums.ac.ir**

ABOUT THE JOURNAL

BMC EMERGENCY MEDICINE

- Considers articles **on all urgent and emergency aspects of medicine**, in both practice and basic research.
- **Open access** journal
- **Peer-reviewed** journal
- All articles published in BMC Emergency Medicine are included in: **Embase, MEDLINE, Scopus, PubMed, ISI(ESCI)...**
- **CiteScore (2018): 1.79**

ABOUT AUTHORS

Diane L. Lorenzetti^{1*} , Hude Quan¹, Kelsey Lucyk¹, Ceara Cunningham¹, Deirdre Hennessy¹, Jason Jiang¹ and Cynthia A. Beck²

INTRODUCTION

- 1) **Chart accuracy** is both a measure and **a means of ensuring the quality** of the care that patients receive.
- 2) **Previous research** suggests that **considerable variation** exists **in the quality of physician documentation.**

INTRODUCTION (CONTINUE)

- 4) **Emergency Departments (ED)** are characterized by frequent staff changes, high activity levels, overcrowding, frequent interruptions, time pressures, uncertain patient arrival patterns, and a wide variety of case presentations.
- 5) In such environments, there is **a pressing need** for methods **to better promote the recording** of *accurate* and *complete* patient care information.
- 6) In recent years, **EMR systems** have been introduced into many EDs to facilitate the documentation of patient care episodes, **but the quality of data in EMR systems remains variable**.

INTRODUCTION (CONTINUE)

- 7) Since **EMR** information is “**necessarily documentation dependent**”, **strategies** to **enhance the quality of physician documentation** can impact the *accuracy, comprehensiveness, and usability* of EMR records.
- 8) Further, as many emergency departments continue to rely on **paper or hybrid charts**, there is a broader need to identify and adopt **effective approaches** to **documentation improvement** that are not exclusively EMR-dependent.
- 9) **Such approaches** may include: *physician education, templates, dictation, and scanning of free-text paper notes into EMRs.*

INTRODUCTION (CONTINUE)

- 10) The extent to which these and other interventions **can improve documentation quality**, particularly in the context of EDs, **is, as yet, unclear**.
- 11) Thus, the **objective** of this study was to **conduct a systematic review** of the **effectiveness of interventions** to **improve the quality of ED physician documentation in emergency settings**.

METHODS

SEARCH STRATEGY

- 1) The **Cochrane** Library, **DARE Database** of Reviews of Effects, **EMBASE**, **MEDLINE**, **PubMed**, and **Web of Science** to **March 2015** to identify relevant **English and French language** peer reviewed literature suitable for inclusion in this review.
- 2) Sources of **grey literature**, including the University of York's Health Technology Database, Current Controlled Trials Register and the websites of government and professional organizations, were similarly searched.
- 3) We also scanned the **reference lists** of included studies and review articles to identify additional studies of relevance to this review.

METHODS

SEARCH STRATEGY

- 4) This review was conducted in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (**PRISMA**) guidelines.
- 5) The protocol for this review **has not been registered in PROSPERO** or any other publicly accessible registry.

METHODS

SEARCH STRATEGY

6) Search strategies combined **search terms** from two themes:

- A. **physicians** (including but not limited to: clinician, physician, doctor, house officer, intern, resident, medical student).
- B. **documentation** (including but not limited to: administrative data, clinical coding, documentation, hospital record, medical chart).

METHODS

STUDY SELECTION

- 1) All abstracts were screened in duplicate, for inclusion in the full text review.
- 2) Three authors independently screened the full texts of all selected abstracts.
- 3) During both screening stages, disagreements were resolved through consensus.

METHODS

STUDY SELECTION

inclusion criteria

- 1) Studies were **included** if they reported on **the results of any intervention** to **improve physician documentation** in **emergency settings**.

exclusion criteria

- 2) Studies were **excluded** if they:
 - were **descriptive** studies or **case reports**,
 - reported only **post-intervention results**,
 - focused on **populations other than physicians, residents or medical students**,
 - centered on **education to improve** history taking, patient care for specific medical conditions, verbal communication skills, or the documentation of non-chart data,
 - focused on documenting or evaluating **student performance**.

METHODS

ASSESSMENT OF STUDY QUALITY

- 1) **Two authors independently** assessed the **quality of included studies**.
- 2) By using **the Downs and Black checklist** of **27 quality criteria** for randomized and non randomized designs.

METHODS

ASSESSMENT OF STUDY QUALITY

- **Downs & Black (1998)** do not explicitly refer to public health practices; however, they do state that the “**Checklist for Measuring Quality**” could be applied to any study **detailing a health care intervention**. Therefore, this instrument is applicable to the critique of studies involving public health interventions.
- Addresses the increasing demand for the use of **evidence from systematic reviews and meta-analyses** to support program and policy decisions in public health decision-making. This tool can be used to **assess the quality of original or primary source research articles** and to synthesize evidence from quantitative studies for public health practitioners, policy makers and decision-makers.
- Administration of the tool can happen either **within a systematic review process**, or as a quality **assessment tool for individual articles**. Within a systematic review, a group guides the review and one or two people administer the tool.

METHODS

ASSESSMENT OF STUDY QUALITY

- The “Checklist for Measuring Quality” is discussed in a three page article and **contains 27 ‘yes’-or-‘no’ questions across five sections**. The tool is easy to use and provides both an overall score for study quality and a numeric score out of a possible 30 points. The five sections include questions about:
 1. **Study quality (10 items)** – the overall quality of the study;
 2. **External validity (3 items)** – the ability to generalize findings of the study;
 3. **Study bias (7 items)** – to assess bias in the intervention and outcome measure(s);
 4. **Confounding and selection bias (6 items)** – to determine bias from sampling or group assignment;
 5. **Power of the study (1 items)** – to determine if findings are due to chance.

METHODS

DATA EXTRACTION

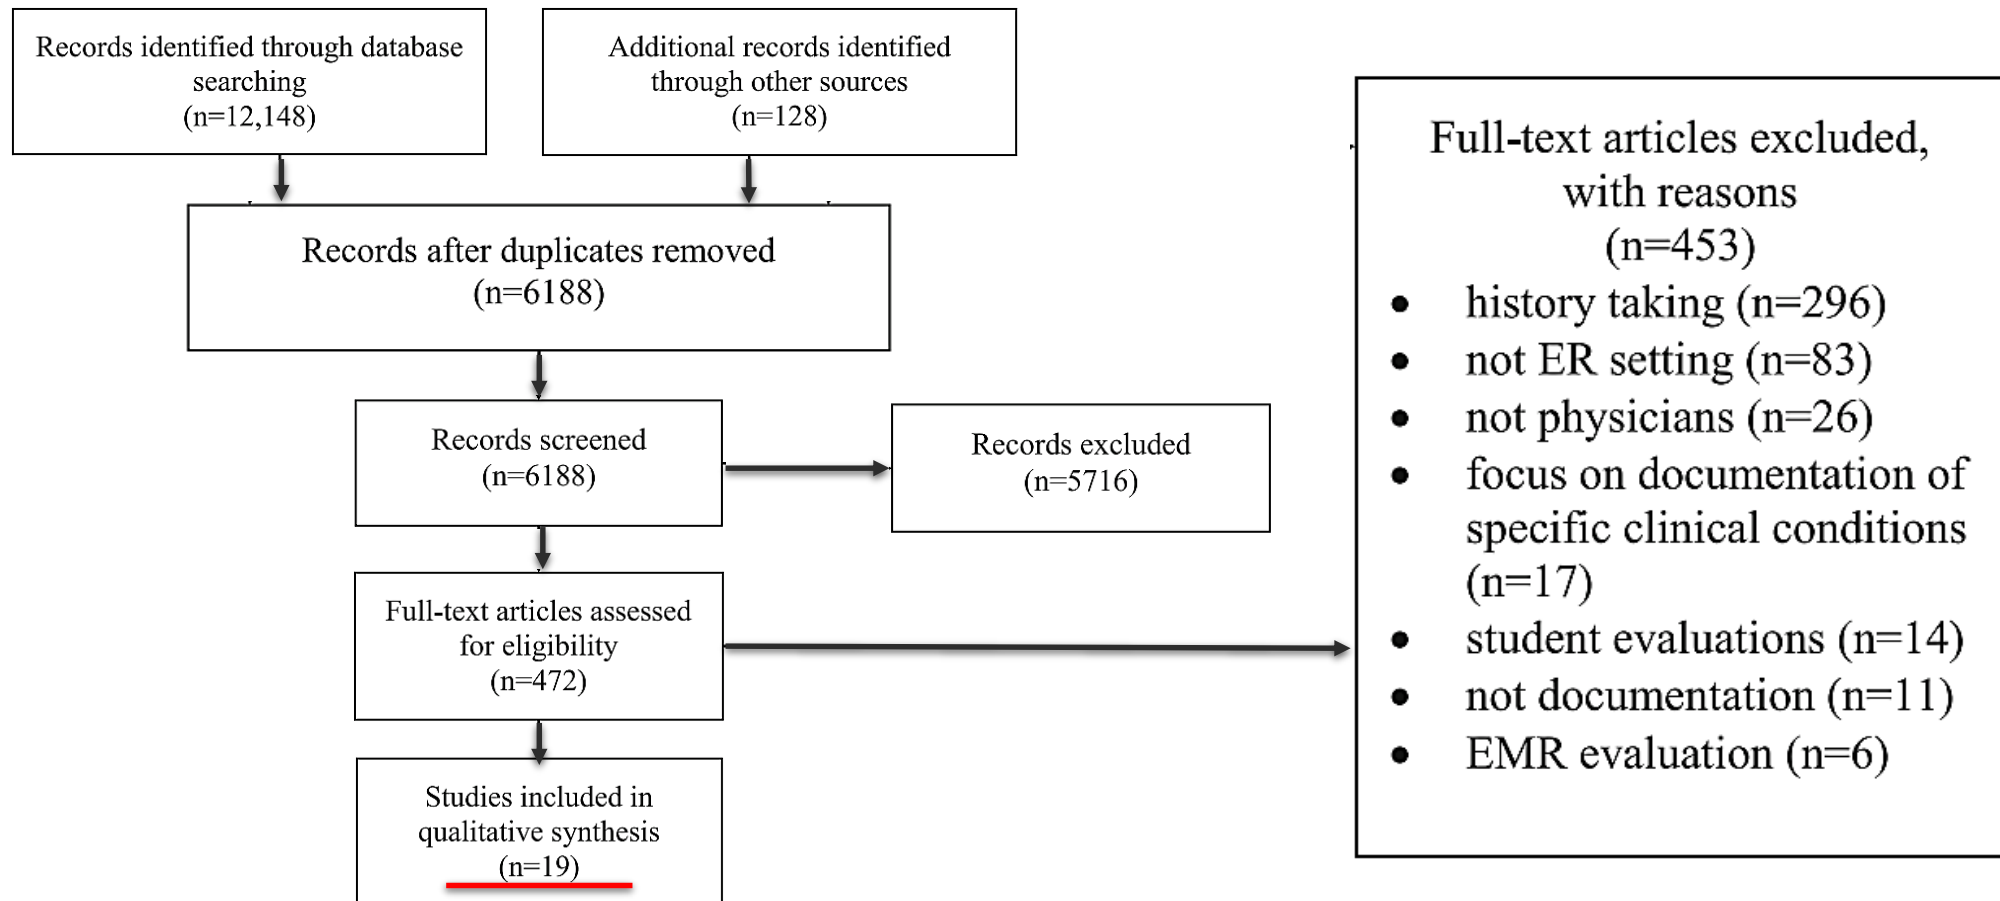

- 1) **Four authors jointly** extracted **data from all included studies** into a standardized form created **in Excel**.
- 2) **Outcomes of interest** included: documentation accuracy, clarity (understandability), legibility, completeness, presence, and timeliness.
- 3) Due to the **heterogeneity** of **study designs**, and **outcomes**, it **was not possible to pool the data** from included studies.

RESULTS

PRISMA FLOW DIAGRAM

RESULTS

CHARACTERISTICS OF INCLUDED STUDIES

Table 1 Characteristics and Outcomes of Included Studies

Author Date Country	Study design ^a	Setting Participants	Intervention(s) Duration	Intervention & Control Group Details	Outcomes of Interest	Results	Downs & Black Quality Score
↑	↑	↑	↑	↑	↑	↑	→
Carter et al. USA (2009)	PPN	<ul style="list-style-type: none"> • Teaching hospital • Residents (R2, R3) 	Multiple Intervention (audit/feedback, education, and reminders) 12 weeks	<p><u>Intervention group</u> <i>n</i> = 24 1-h lecture to 18/24 residents Pocket card and lecture handouts to 24/24 residents and biweekly newsletters. Physicians received weekly case specific chart audit/feedback.</p> <p><u>Control group</u> (<i>n</i> = 24) Usual electronic documentation program</p>	<ul style="list-style-type: none"> • Chart level, based on complexity of decision making and detail of history and physical. • RVU (relative value units). • Billings/hr. 	<ul style="list-style-type: none"> • Intervention resulted in more complex charting (27% vs 19%, <i>p</i> < .01) and fewer mid-level charts (<i>p</i> < .01). • RVUs increased with intervention (3.71 vs 3.17, <i>p</i> < .01). • Billings increased with intervention (\$354.08 vs \$303.79, <i>p</i> < .01). 	19/27

RESULTS

TYPES OF INTERVENTIONS (STRATEGIES)

Seven interventions were identified to improve physician documentation in ED settings. These included:

- 1) **Audit/feedback** (n = 2),
- 2) **Dictation** (n = 2),
- 3) **Education** (n = 1),
- 4) **Facilitation** (n = 1),
- 5) **Reminders** (n = 2),
- 6) **Structured paper templates** (n = 7),
- 7) **Multi-interventions** (n = 4) that incorporated two or more approaches to improving documentation.

RESULTS

AUDIT/FEEDBACK (N = 2)

Table 1 Characteristics and Outcomes of Included Studies (Continued)

Author Date Country	Study design ^a	Setting Participants	Intervention(s) Duration	Intervention & Control Group Details	Outcomes of Interest	Results	Downs & Black Quality Score
Hanson et al. UK (1994)	TSS	• 2 Teaching hospitals • House Officers	Audit/Feedback 19 weeks	Intervention group $n = 420$ (Feedback 1); 429 (Feedback 2); 244 (Final audit – weeks 20–24) Phase I: Feedback at 6 weeks in form of individual audit/feedback and group discussion. Phase II: Feedback at week 11. Further audit during weeks 11–16. Post-intervention final audit weeks 20–24. Control group $n = 401$ No feedback. Baseline audits. Usual paper charts.	• Proportion of head injury charts documenting GCS (Glasgow Coma Scale). • Proportion of charts documenting diagnostic coding for all patients.	• Significant improvement in GCS documentation for both hospitals for patients with head injuries during all phases of the study – (80% Feedback 1, 88% Feedback 2, 90% Final Audit vs 40% at baseline). • Significant improvement in diagnostic coding for Hospital A from baseline ($p < .008$).	18/27
Heidt & Griffey USA (2012)	PPN	• Teaching hospital • Emergency Physicians	Audit/Feedback 12 weeks	Intervention group $n = 382$ Individualized email feedback from coders to physicians whose charts lacked sufficient documentation to warrant the inclusion of critical care billing codes Control group $n = 501$ No feedback.	Proportion of ICU (intensive care unit) admissions that documented critical care time.	Significant increase in the number of charts documenting critical care time (64% vs 18%, $p < .001$).	10/27

significantly improved the richness (presence and completeness) of physician documentation

RESULTS

DICTATION (N = 2)

Table 1 Characteristics and Outcomes of Included Studies

Author Date Country	Study design ^a	Setting Participants	Intervention(s) Duration	Intervention & Control Group Details	Outcomes of Interest	Results	Downs & Black Quality Score
Zick & Olsen USA (2001)	PPN	• Suburban level 1 trauma centre • Physicians	Dictation Not specified	<u>Intervention group</u> n = 47 Dragon Naturally Speaking voice recognition software. 30 min training for physician. <u>Control group</u> n = 47 Traditional voice transcription services	Difference in accuracy (per cent of words correct in document).	Decrease in accuracy of words documented (98.5% vs 99.7% - change of -1.2; CI (-1.5 to -0.8))	17/27

Zick and Olsen (2001) compared voice recognition software (Dragon Naturally Speaking®) to traditional dictation. While completion time **decreased** with the use of voice recognition software (Dragon Naturally Speaking) so too did the overall **accuracy** of physician documentation.

RESULTS

EDUCATION (N = 1)

Table 1 Characteristics and Outcomes of Included Studies (*Continued*)

Author Date Country	Study design ^a	Setting Participants	Intervention(s) Duration	Intervention & Control Group Details	Outcomes of Interest	Results	Downs & Black Quality Score
Otillo et al. USA (2014)	PPC	• Academic children's hospital • Pediatric residents	Education 112 weeks	<u>Intervention group</u> <i>n</i> = 157 One-hour lecture <u>Control group</u> <i>n</i> = 145 No education	Proportion of charts with documentation of 3 specific findings.	No change in right lower quadrant tenderness documentation (for example): 43.9% vs. 35.9%, 95% CI -19 to + 3	20/27

- A **lecture for one hour** on medical liability.
- Researchers found **no difference** in the **richness (presence and completeness)** of the charts documented post-lecture.

RESULTS

REMINDERS (N = 2)

Table 1 Characteristics and Outcomes of Included Studies

Author Date Country	Study design ^a	Setting Participants	Intervention(s) Duration	Intervention & Control Group Details	Outcomes of Interest	Results	Downs & Black Quality Score
Van Amstel et al. Canada (2004)	PPN	• Pediatric teaching hospital • Physicians	Reminder/ 4 weeks	<u>Intervention group</u> n = 153 HEADSS (Home, Education, Alcohol, Drugs, Smoking, Sex) stamp in patient charts to remind physicians to document these data items in charts. <u>Control group</u> n = 153 Usual paper charts	• Difference in proportion of charts containing information on psychosocial problems related to: Home, Education, Alcohol, Drugs, Smoking, Sex • Extent of global documentation • Proportion of charts with newly documented psychosocial problems in the above focus areas.	• Significant increase in proportion of charts documenting education (p = .029), alcohol (p = .045), smoking (p = .009) and interview alone (p = .0001). Non-significant changes for remaining topics. • Overall increase in psychosocial history documentation (9% vs > 1%, p = .003) • Overall increase in newly documented psychosocial problems (16% vs. 10%, p = .05).	20/27

Van Armstel et al. (2004) noted a **significant increase** in **overall documentation**.

RESULTS

TEMPLATES/FORMS (N = 7)

Table 1 Characteristics and Outcomes of Included Studies

Author Date Country	Study design ^a	Setting Participants	Intervention(s) Duration	Intervention & Control Group Details	Outcomes of Interest	Results	Downs & Black Quality Score
O'Connor et al. New Zealand (2001)	PPN	• Non-teaching rural hospital • Physicians	Template 2 weeks	Intervention group <i>n</i> = 96 Preformatted emergency department charts with 8 key content items Control group <i>n</i> = 137 Usual paper charts	• Median number of parameters filled in for each chart, out of 8. • Proportion of charts recording each of 8 parameters.	• Significant mean increase in the number of parameters documented in each chart (8 vs 7, <i>p</i> = .005). • Significant positive change in the recording of one parameter – Physician Name (52% vs 18%, <i>p</i> < .0001).	19/27

O'Connor et al. (2001) found that, while templates resulted in a **significant mean increase** in a **number of “key content items,”** the only consistent improvement was in the recording of physicians' names.

RESULTS

MULTIPLE INTERVENTIONS (N = 4)

Table 1 Characteristics and Outcomes of Included Studies

Author Date Country	Study design ^a	Setting Participants	Intervention(s) Duration	Intervention & Control Group Details	Outcomes of Interest	Results	Downs & Black Quality Score
Carter et al. USA (2009)	PPN	• Teaching hospital • Residents (R2, R3)	Multiple Intervention (audit/feedback, education, and reminders) 12 weeks	<u>Intervention group</u> n = 24 1-h lecture to 18/24 residents Pocket card and lecture handouts to 24/24 residents and biweekly newsletters. Physicians received weekly case specific chart audit/feedback. <u>Control group</u> (n = 24) Usual electronic documentation program	• Chart level, based on complexity of decision making and detail of history and physical. • RVU (relative value units). • Billings/hr.	• Intervention resulted in more complex charting (27% vs 19%, $p < .01$) and fewer mid-level charts ($p < .01$). • RVUs increased with intervention (3.71 vs 3.17, $p < .01$). • Billings increased with intervention (\$354.08 vs \$303.79, $p < .01$).	19/27

Carter et al. (2009) found **improvements** in the completeness of physicians' chart documentation as a result of lectures, pocket reminders, and case-specific chart audit/feedback.

DISCUSSION

PRINCIPAL FINDINGS AND COMPARISON WITH PRIOR WORK

1. To our knowledge, this is **the first systematic review of the effectiveness of interventions to improve ED documentation.**
2. Although EMRs and other technologies may facilitate improvements in the quality of ED physician documentation, it is ultimately how these **technologies** are **designed, implemented,** and **used** that will determine their effectiveness.

DISCUSSION

OTHER APPROACHES AND TECHNOLOGY

- 1) **Successful approaches** will likely be those that can **adapt to different settings**, be seamlessly **integrated into existing workflows**, and garner widespread **acceptance from all relevant stakeholders**.
- 2) In the future, it may be possible to **embed artificial intelligence technologies, into EMR systems** to **alert physicians** to patient information or physician orders that are potentially inaccurate, imprecise, incomplete, or inappropriate.
- 3) Payne and colleagues described the development of **a mobile app to convert voice-recorded patient notes into EMR-compatible text.**(2018)

DISCUSSION

OTHER APPROACHES AND TECHNOLOGY

- 4) Researchers at Stanford University are designing “**digital scribe**” software that will incorporate artificial intelligence and voice recognition to enable physicians to create comprehensive, quality patient **data that can be uploaded to EMR systems in real time**.(2018)
- 5) If successful, these and similar initiatives may facilitate the creation of **quality** of electronic patient data, while simultaneously **reducing administrative and workflow burdens** associated with EMR systems.

DISCUSSION

OTHER APPROACHES AND TECHNOLOGY

- 6) Although ongoing technological advances may radically improve the quality of physician documentation, it is important to note that **transforming documentation practices** also **requires changing learned behavior, or habits**.
- 7) As habits are formed over sustained periods of time, **interventions designed to alter behavioral** norms should similarly be of long duration.
- 8) To effect **lasting and meaningful improvements** in ED documentation, it may be necessary to directly **involve all stakeholders**, including physicians and residents, in selecting, contextualizing, implementing, and conducting ongoing evaluations of multifaceted approaches to improving documentation quality in EDs.

DISCUSSION

CAVEATS AND LIMITATIONS

- 1) While we employed an extremely comprehensive search strategy, **inconsistencies in the indexing of studies** in electronic databases and our decision to **restrict our search to English or French language** publications, may have **impacted on our ability to identify all relevant studies**.
- 2) Further, **variability in study design and outcomes** assessed across studies **limited our ability** to quantitatively compare the outcomes from individual studies, and assess the overall effectiveness of many of these approaches.

DISCUSSION

CAVEATS AND LIMITATIONS

- 3) The literature on ED physician documentation improvement is yet in its infancy,
- 4) and that **further research is required** to determine how best to encourage documentation improvements in these settings.

CONCLUSIONS

FUTURE RESEARCH

- 1) This review suggest that mentioned interventions are potentially **promising approaches** to improving physician documentation.
- 2) **Future research** should focus on **exploring the impact** of implementing these interventions in EDs with and without EMRs, and investigating the potential of **emerging technologies** to advance ongoing improvements in physician documentation in ED settings.

Thanks for Your Attention
